Cyclistic bike-share company

Understand the difference between how casual riders and annual members use Cyclistic bikes differently. From these insights, we will design a new marketing strategy to convert casual riders to annual members.

How do annual members and casual riders use Cyclistic bikes differently?

Business task: analyze how annual members and casual riders use Cyclistic bikes and identify any opportunities to convert casual riders to annual members.

Prepare: the data source I used is from divvy-tripdata. I collected data from August 2024-July 2025.

Process: opened every data set in microsoft excel. In every excel file, I created two columns(ride_length and day_of_week). The ride_length column includes the ride length for each trip with a bike. I used the formula =D2-C2 and converted the column to time HH:MM:SS. The second column is which day of the week the ride occurred on. This is done by using the =weekday command where 1=sunday and 7=saturday.

Analyze: based on my initial analysis, i have noticed, winter months have less avg ride length and less total rides. During the summer months, people use the bikes more and have longer rides on them. The average total ride length for the summer months was 16:30-18:45 minutes long. Casual riders on average would take longer rides than members. The winter months had an average ride time of 10:45-12:00 minutes. This is over 4 minutes less ride time during the winter. Casual riders have significantly less rides during the winter months than the members do. Casual riders are also taking longer average rides than members do. Every month the casual riders, ride length is significantly higher than the members' ride length. This could have something to do with casual riders mostly using bikes on the weekends where as members are using the bikes during the week.

Most common day for each month total
